

CLEANER. QUIETER. SAFER. MORE EFFICIENT. DOES THIS DESCRIBE YOUR FRAC OPERATIONS?

Team with NexTier to optimize your operations. We've engineered a method to turn off frac pump engines between stages – and then restart them when it's time to pump again.

Our innovative Hibernate warm-start system enables us to make quick, reliable group starts to get multiple pumps going at once.

- Less equipment wear, which improves efficiency, reduces NPT and enables more stages per day for increased ROI
- Reduced fuel consumption, improved air quality and less noise – which leads to a greener worksite, improved economics and safer conditions
- Reduced personnel exposure to heavy machinery, which improves operational safety
